What Is Dzukku?

Dzukku is an AI-powered restaurant ordering and operations platform. Customers order through chat, while the restaurant team manages orders, kitchen preparation, table service, delivery, invoices, and analytics from a role-based POS workspace.

In simple terms: Dzukku talks to the customer, captures the order, sends it to the right team, tracks the work, and gives the owner a clear view of the business.

1

Customers order naturally

Through Telegram, WhatsApp-style chat, QR links, and simple buttons such as Menu, Order, Cart, and Reserve.

2

Staff work from live queues

Admin, waiter, and kitchen teams see the right screen for their role and work from the same order flow.

3

Owners gain control

Daily orders, pending load, revenue, top activity, and operations become visible instead of scattered.

BUSINESS CHALLENGE

The Problem Restaurants Face Today

Restaurants do not only need online ordering. They need an operating system that connects customer demand with kitchen execution and business visibility.

Heavy aggregator dependency

Marketplaces are useful for discovery, but repeat customers often still go through commission-heavy channels.

Scattered operations

Orders, tables, reservations, kitchen status, delivery, and billing may live in different tools or staff memory.

Customer app fatigue

Customers do not want another complicated ordering app. They want quick recommendations and simple confirmation.

Limited owner visibility

Owners need to know what is selling, what is delayed, what is pending, and where the business can improve.

BUSINESS OUTCOME

Dzukku connects the full restaurant journey.

1

Customer asks

Chat, QR, menu, reservation, or quick reorder.

2

AI assists

Recommends, confirms, and collects details.

3

Order appears

Admin/POS receives a structured order.

4

Kitchen executes

Items move pending, cooking, done.

5

Revenue, orders, delays, and demand become visible.

What The Product Includes

Dzukku is a connected set of business modules, not a single chatbot. Each module maps to a real restaurant workflow.

Conversational menu help, item selection, cart, customer details, confirmation, and channel choice.

POS Command Center

Live dashboard for orders, revenue, pending load, kitchen count, invoices, and staff operations.

Kitchen Display

Pending, cooking, and done stages so the back of house works from a clear queue.

Waiter Portal

Table map, guest sessions, dine-in orders, kitchen fire, and bill generation.

Reservations

Chat-based table booking with guest count, date, time, and special request handling.

Delivery Workflow

Driver assignment, status tracking, proof of delivery, and customer progress updates.

Invoices & Settlements

Billing, paid status, direct/platform settlement visibility, and daily reconciliation support.

Multi-Outlet Readiness

Separate menus, staff, orders, customers, dashboards, and brand-specific AI assistants by branch.

Role-Based Workspaces Make It Easy For Non-Technical Teams

A good restaurant system should not overwhelm staff. Dzukku separates work by role so each team sees only the controls they need.

One product, three operating rooms

Admin/POS manages full operations. Waiter handles floor service. Kitchen handles preparation. This separation improves adoption and keeps work focused.

Admin / POS

Orders, menu, staff, payments, deliveries, invoices, reservations, and analytics.

Waiter

Table map, active sessions, cart building, kitchen fire, and checkout support.

Kitchen

Item-level KDS queue with pending, cooking, and done status movement.

Owner Dashboard: The Daily Business Snapshot

Live visibility for owners and managers

The dashboard gives decision-makers a shift-level picture: total orders, revenue, pending work, delivered orders, live sync, kitchen count, and order trends. This helps managers act during the day, not only after closing.

Sales view

Revenue, order count, peak hours, and demand patterns.

Operations view

Pending orders, kitchen load, ready orders, and service bottlenecks.

Growth view

Top dishes, repeat orders, direct channel adoption, and campaign opportunities.

From customer request to restaurant execution

The orders screen makes work visible: order references, customer names, ordered items, totals, source channel, and current status. This gives the team a shared truth and reduces repeated checking between counter, kitchen, delivery, and management.

Business value: fewer lost orders, clearer accountability, faster follow-up, and better service consistency.

Built For Real Restaurant Service

Waiter Portal

Waiters can open table sessions, see available and occupied tables, manage guests, send orders to kitchen, and complete checkout.

Kitchen Display

Kitchen staff can move every line item from pending to cooking to done while admin and waiter screens stay aligned.

Front of house benefit

Staff can answer customer questions because kitchen readiness is visible.

Back of house benefit

The kitchen gets a structured queue instead of scattered verbal instructions.

Customers Order Through A Familiar Chat Interface

Dzukku is simple for customers because it does not force them to learn a new app. They can chat, tap quick actions, choose direct Dzukku ordering, or use supported delivery channels.

Direct Dzukku Ordering

Best for repeat customers, QR ordering, table ordering, packaging links, and social campaigns.

Swiggy Channel Support

Customers who prefer Swiggy can still be guided through a familiar conversational path.

Zomato Channel Support

Dzukku can preserve flexibility while direct ordering remains the preferred repeat-customer path.

Why Businesses Should Consider Dzukku

Restaurants can promote QR and chat ordering to repeat customers instead of depending only on marketplace apps.

Lower operational confusion

Orders, kitchen readiness, table sessions, and delivery status become visible in one workflow.

USE CASES

Where Dzukku Fits

CLOUD KITCHEN

Direct online orders and kitchen discipline

Accept direct chat orders, manage prep queues, coordinate delivery, and track demand patterns.

DINE-IN RESTAURANT

Table service and kitchen alignment

Manage tables, guest sessions, waiter orders, reservations, kitchen tickets, and bills.

CAFE / QSR

Quick repeat ordering

Make menu browsing, combos, pickup orders, and preparation updates faster for regular customers.

RESTAURANT GROUP

Multi-outlet control

Give each branch separate operations while owners compare performance centrally.

Not a replacement for every aggregator use case.

Swiggy and Zomato remain useful for new customer discovery. Dzukku is strongest for direct ordering, repeat customers, dine-in operations, restaurant-owned loyalty, and branch-level management.

Recommended Implementation Approach

The best rollout is staged. Start small, prove value, train teams, then expand into deeper workflows and multiple branches.

Common Business Questions

Is this only a chatbot?

No. Chat is the customer entry point. The platform also includes POS, KDS, tables, reservations, invoices, delivery workflows, and analytics.

Can non-technical staff use it?

Yes. Staff use role-based screens, so each team sees the workflow that matches their daily responsibilities.

Will it replace Swiggy or Zomato?

Not necessarily. Aggregators are useful for discovery. Dzukku is best for direct ordering, repeat customers, and restaurant-owned operations.

Can it support multiple branches?

Yes. The platform can grow into separate menus, staff, customers, orders, dashboards, and AI personalities by branch.

How do we measure success?

Track direct orders, chat conversion, repeat customers, average order value, kitchen time, cancellations, and customer feedback.

What should we launch first?

Start with one outlet, one menu, one ordering channel, one dashboard, and one kitchen queue. Expand after the workflow is proven.

Consultant recommendation: begin with a controlled pilot for repeat customers. Prove direct ordering and kitchen visibility first, then expand into loyalty, payments, delivery automation, and multi-branch reporting.
